

Broadband over Power Lines is a pollution causing technology. Why would we purposefully allow this technology to proliferate at the expense of licensed operations? The BPL industry seems intent on requiring that we "trust them. Why have two countries already banned the use of BPL? Before this is allowed to go any further, there must be definitive proof that there will be no harm to any licensed service. To do otherwise is not in the public interest of this nation.

It is amazing to me that the power industry would waste money on this, when the basic power grid of this country is in such need of attention.
